## MUST KNOW DEFINITIONS

|  | Matter is defined as anything that has mass and occupies space. All matter is composed of atoms. |
| :---: | :---: |
| Mixtures | Mixtures consist of more than one chemical entity present without any chemical interactions. |
| Pure substances | Pure substances are composed of simple atoms or molecules. They are further classified as elements and compounds. |
| Element | An element consists of only one type of atom. <br> Element can exist as monatomic or polyatomic units. The polyatomic elements are called molecules. |

| Compound | Compounds are made up of molecules which contain two or more atoms of different elements. |
| :---: | :---: |
| Relative atomic mass | The relative atomic mass is defined as the ratio of the average atomic mass factor to the unified atomic mass unit. |
| Relative molecular mass | Relative molecular mass is defined as the ratio of the mass of a molecule to the unified atomic mass unit. The relative molecular mass of any compound can be calculated by adding the relative atomic masses of its constituent atoms. |
| Mole | One mole is the amount of substance that contains as many elementary particles as the number of atoms in 12 g of carbon-12 isotope. |
| Avogadro Number | The total number of entities present in one mole of any substance is equal to $6.022 \times 10^{23}$. This number is called Avogadro number |
| Molar Mass | Molar mass is defined as the mass of one mole of a substance. The molar mass of a compound is equal to the sum of the relative atomic masses of its constituents expressed in $\mathrm{g} \mathrm{mol}^{-1}$. |
| Molar Volume | The volume occupied by one mole of any substance in the gaseous state at a given temperature and pressure is called molar volume. |
| Gram equivalent mass | Gram equivalent mass of an element, compound or ion is the mass that combines or displaces 1.008 g hydrogen or 8 g oxygen or 35.5 g chlorine. |
| Empirical formula | Empirical formula of a compound is the formula written with the simplest ratio of the number of different atoms present in one molecule of the compound as subscript to the atomic symbol. |
| Molecular formula | Molecular formula of a compound is the formula written with the actual number of different atoms present in one molecule as a subscript to the atomic symbol. |
| Stoichiometry | Stoichiometry is the quantitative relationship between reactants and products in a balanced chemical equation in moles. The quantity of reactants and products can be expressed in moles or in terms of mass unit or as volume. |
| Limiting reagent | when a reaction is carried out using non-stoichiometric quantities of the reactants, the product yield will be determined by the reactant that is completely consumed. It limits the further reaction from taking place and is called as the limiting reagent. |
| Oxidation Nu | It is defined as the imaginary charge left on the atom when all other atoms of the compound have been removed in their usual oxidation states that are assigned according to set of rules. |
| Combination reactions | Redox reactions in which two substances combine to form a single compound are called combination reaction. |
| Decomposition reaction | Redox reactions in which a compound breaks down into two or more components are called decomposition reactions. These reactions are opposite to combination reactions. |
| Displacement reactions | Redox reactions in which an ion (or an atom) in a compound is replaced by an ion (or atom) of another element are called displacement reactions. |
| Disproportionation reaction | In some redox reactions, the same compound can undergo both oxidation and reduction. In such reactions, the oxidation state of one and the same element is both increased and decreased. These reactions are called disproportionation reactions. |

Answer All the Questions 5 MARK

1. Define oxidation number. Balance the following equation using oxidation number method.

$$
\begin{aligned}
\mathrm{As}_{2} \mathrm{~S}_{3}+\mathrm{HNO}_{3}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathbf{H}_{3} \mathrm{AsO}_{4}+\mathrm{H}_{2} \mathrm{SO}_{4} \\
+ \text { NO [Govt. MQP-2018] }

$$

Ans. Oxidation number : It is defined as the imaginary charge left on the atom when all other atoms of the compound have been removed in their usual oxidation states that are assigned according to set of rules.

This is Only for Sample for Full Book Order Online and Available at All Leading Bookstores

Solution :
Step 1 : $\mathrm{As}_{2} \mathrm{~S}_{3}+\mathrm{HNO}_{3}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{H}_{3} \mathrm{AsO}_{4}+$
Step 2 : Assign the oxidation numbers and identify the redox couples.

Step 3 : Multiply $\mathrm{As}_{2} \mathrm{~S}_{3}$ by 3 and $\mathrm{HNO}_{3}$ by 2 .

Step 4 : Balance all the elements in the equation
(As, S and N ) except H and O .
$3 \mathrm{As}_{2} \mathrm{~S}_{3}+2 \mathrm{HNO}_{3}+\mathrm{H}_{2} \mathrm{O} \longrightarrow 6 \mathrm{H}_{3} \mathrm{AsO}_{4}+9 \mathrm{H}_{2} \mathrm{SO}_{4}$
+2 NO
Step 5 : Balance the complete equation including O \& H.
$3 \mathrm{As}_{2} \mathrm{~S}_{3}+28 \mathrm{HNO}_{3}+\mathrm{H}_{2} \mathrm{O} \xrightarrow[9 \mathrm{H}_{2} \mathrm{SO}_{4}+28 \mathrm{NO}]{6 \mathrm{H}_{3} \mathrm{AsO}_{4}}+$
2. What are disproportionation reaction. (or) What are auto redox reactions? Give an example.
[June 2019]
Ans. Disproportionation reaction (Auto redox reactions) : In some redox reactions, the same compound can undergo both oxidation and reduction. In such
 reactions, the oxidation state of one and the same element is both increased and decreased. These reactions are called disproportionation reactions.
3. Define limiting reagent. [Govt. MQP-2018; QY. 2018]

Ans. Limiting reagent : When a reaction is carried out using non-stoichiometric quantities of the reactants, the product yield will be determined by the reactant that is completely consumed. It limits the further reaction from taking place and is called as the limiting reagent.
4. Calculate the empirical and molecular formula of the compound containing $80 \%$ Carbon, $20 \%$ Hydrogen. If the molecular mass of the compound is $\mathbf{3 0}$ then determine the molecular formula.
[QY. 2019]
Ans. For C $\Rightarrow 80 / 12=6.6$
for $\mathrm{H} \Rightarrow 20 / 1=20$ now divide 6.6 and 20 by 6.6 to get simple whole no. ratio of C and H which will come 1:3 so emperical formula is $\mathrm{CH}_{3}$ and its mass is 15
Now to calculate $n$ we have $30 / 15=2$
so molecular formula is $\mathrm{CH}_{3} \times 2=\mathrm{C}_{2} \mathrm{H}_{6}$

## REDOX REACTION ACTIUITY

1. A piece of cut apple becomes brown. Why? Can you prevent it by a simple method?
Ans. Apple turns brown when cut since the surface is exposed to air and undergoes oxidation. It can be prevented by dipping sliced apples in lemon juice. Lemon juice is an antioxidant which takes in all the available oxygen and prevents it from reaching the apple's tissues.
2. Place an iron piece in a moist atmosphere and observe it after two days. Is there any deposition of new substance? Why does it happen? What is this phenomenon called?
Ans. When iron is exposed to moist air, the iron reacts with oxygen in the presence of moisture to from a reddish - brown chemical compound, iron - oxide. This phenonaenon is called rusting. A new substance Iron (III) oxide is formed. $4 \mathrm{Fe}(\mathrm{OH})_{2}+\mathrm{O}_{2}+x \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{Fe}_{2} \mathrm{O}_{3}(x+4) \mathrm{H}_{2} \mathrm{O}$

4. An iron nail is placed in copper sulphate solution taken in the beaker. Observe it for some time? Find the changes that takes place and why?
Ans. When iron nail is dipped in copper sulphate solution, the colour of copper sulphate tuns from blue to light green and reddish brown deposits is formed on iron nail. This is because iron is more reactive than copper, so it displaces Cu from $\mathrm{CuSO}_{4}$ solution. The displacement reaction can be written as $\mathrm{CuSO}_{4}+\mathrm{Fe} \rightarrow \mathrm{FeSO}_{4}+\mathrm{Cu}$
