PREFACE

The woods are lovely, dark and deep. But I have promises to keep, and **miles to go before I sleep**

- Robert Frost

Respected Principals, Correspondents, Head Masters / Head Mistresses, Teachers, and dear Students.

From the bottom of our heart, we at SURA Publications sincerely thank you for the support and patronage that you have extended to us for more than a decade.

It is in our sincerest effort we take the pride of releasing **SURA'S Business Mathematics and Statistics** for +2 Standard. This guide has been authored and edited by qualified teachers having teaching experience for over a decade in their respective subject fields. This Guide has been reviewed by reputed Professors who are currently serving as Head of the Department in esteemed Universities and Colleges.

With due respect to Teachers, I would like to mention that this guide will serve as a teaching companion to qualified teachers. Also, this guide will be an excellent learning companion to students with exhaustive exercises, additional problems and 1 marks as per new model in addition to precise answers for exercise problems.

In complete cognizance of the dedicated role of Teachers, I completely believe that our students will learn the subject effectively with this guide and prove their excellence in Board Examinations.

I once again sincerely thank the Teachers, Parents and Students for supporting and valuing our efforts.

God Bless all.

APPLICATIONS OF MATRICES AND DETERMINANTS

CHAPTER SNAPSHOT

Rank of a matrix :-

The rank of a matrix A is the order of the largest non-zero minor of A and is denoted by ρ (A).

- (i) $\rho(A) \ge 0$.
- (ii) If A is a matrix of order $m \times n$, then $\rho(A) \le \min\{m, n\}$.
- (iii) Rank of a zero matrix is 0.
- (iv) The rank of a non singular matrix of order $n \times n$ is "n".

Elementary transformations :

(i) Interchange any two rows (or columns)

 $\mathbf{R}_i \leftrightarrow \mathbf{R}_j \ (\mathbf{C}_i \leftrightarrow \mathbf{C}_j)$

(ii) Multiplication of each element of a row (or column) by any non-zero scalar k.

 $\mathbf{R}_i \rightarrow k \mathbf{R}_i \text{ (or } \mathbf{C}_i \rightarrow k \mathbf{C}_i \text{)}$

(iii) Addition to the elements of any row (or column) the same scalar multiples of corresponding elements of any other row (or column).

$$R_i \rightarrow R_i + k R_i \text{ (or } C_i \rightarrow C_i + k C_i)$$

Equivalent matrices:

Two matrices A and B are said to be equivalent if one is obtained from the another by applying a finite number of elementary transformations.

 $A \cong b$

Echelon form :

A matrix A of order $m \times n$ is said to be in echelon form if

- (i) Every row of A which has all its entries 0 occurs below every row which has a non zero entry.
- (ii) The number of zeros before the first non zero element in a row is less than the number of such zeros in the next row.

Transition matrix :

The transition probabilities P_{jk} satisfy $P_{jk} > 0$, $\sum_{k} P_{jk} = 1$ for all j

FORMULAE TO REMEMBER

- Linear equations can be written in matrix form AX = B, then the solution is X = A⁻¹ B, provided |A| ≠ 0.
- 2. Consistency of non homogeneous linear equations by rank method.
- (i) If $\rho([A,B]) = \rho(A)$, then the equations are consistent.
- (ii) If $\rho([A,B]) = \rho(A) = n$, where *n* is the number of variables then the equations are consistent and have unique solution.
- (iii) If $\rho([A,B]) = \rho(A) < n$, then the equations are consistent and have infinitely many solutions.
- (iv) If $\rho([A,B]) \neq \rho(A)$, then the equations are inconsistent and has no solution.

TEXTUAL QUESTIONS

1. Find the rank of each of the following matrices.

(i)
$$\begin{pmatrix} 5 & 6 \\ 7 & 8 \end{pmatrix}$$

(ii) $\begin{pmatrix} 1 & -1 \\ 3 & -6 \end{pmatrix}$
(iii) $\begin{pmatrix} 1 & 4 \\ 2 & 8 \end{pmatrix}$ [FRT - 2022]
(iv) $\begin{pmatrix} 2 & -1 & 1 \\ 3 & 1 & -5 \\ 1 & 1 & 1 \end{pmatrix}$
(v) $\begin{pmatrix} -1 & 2 & -2 \\ 4 & -3 & 4 \\ -2 & 4 & -4 \end{pmatrix}$ [July - 2022]
(vi) $\begin{pmatrix} 1 & 2 & -1 & 3 \\ 2 & 4 & 1 & -2 \\ 3 & 6 & 3 & -7 \end{pmatrix}$
(vii) $\begin{pmatrix} 1 & 2 & -1 & 3 \\ 2 & 4 & 1 & -2 \\ 3 & 6 & 3 & -7 \end{pmatrix}$
(vii) $\begin{pmatrix} 3 & 1 & -5 & -1 \\ 1 & -2 & 1 & -5 \\ 1 & 5 & -7 & 2 \end{pmatrix}$
(viii) $\begin{pmatrix} 1 & -2 & 3 & 4 \\ -2 & 4 & -1 & -3 \\ -1 & 2 & 7 & 6 \end{pmatrix}$ [FRT - 2022]
Sol : (i) Let A = $\begin{pmatrix} 5 & 6 \\ 7 & 8 \end{pmatrix}$
Order of A is 2 × 2
 $\therefore \rho$ (A) ≤ 2 [Since minimum of (2, 2) is 2]

Here $\rho(A) = \rho(A, B) = 2 <$ Number of unknowns. \therefore The system is consistent with infinitely many solutions let us rewrite the above echelon form into matrix form.

$$\begin{pmatrix} 1 & \frac{26}{3} & \frac{2}{3} \\ 0 & \frac{-11}{3} & \frac{1}{3} \\ y \\ z \end{pmatrix} = \begin{pmatrix} 3 \\ -1 \\ 0 \end{pmatrix}$$

$$x + \frac{26}{3} y + \frac{2}{3} z = 3 \qquad \dots (1)$$

$$\frac{-11}{3} y + \frac{1}{3} z = -1 \qquad \dots (2)$$
let $z = k$; where $k \in \mathbb{R}$

$$(2) \Rightarrow \frac{-11}{3} y + \frac{k}{3} = -1$$

$$\Rightarrow \qquad \frac{-11}{3} y + \frac{k}{3} = -1$$

$$\Rightarrow \qquad \frac{-11}{3} y = -1 - \frac{k}{3} = \frac{-3 - k}{3}$$

$$\Rightarrow \qquad -11y = -3 - k$$

$$\Rightarrow \qquad 11y = 3 + k$$

$$\Rightarrow \qquad y = \frac{1}{11} (3 + k)$$
Substituting $y = \frac{1}{11} (3 + k)$ and $z = k$ in (1) we get,
 $x + \frac{26}{3} \left(\frac{3 + k}{11}\right) + \frac{2}{3} k = 3$

$$x = -\frac{26}{3} \left(\frac{3 + k}{11}\right) - \frac{2k}{3} + 3$$

$$= \frac{-78 - 26k}{33} - \frac{2k}{3} + 3 = \frac{-78 - 26k - 22k + 99}{33}$$

$$= \frac{21 - 48k}{33} = \frac{3(7 - 16k)}{33} \Rightarrow x = \frac{1}{11} (7 - 16k)$$

$$\therefore$$
 Solution set is $\{\frac{1}{11} (7 - 16k), \frac{1}{11} (3 + k), k\} k \in \mathbb{R}$.
Hence, for different values of k , we get infinitely many solutions.

Sol : Transition probability matrix $T = {A \atop B} \begin{pmatrix} 0.65 & 0.35 \\ 0.45 & 0.55 \end{pmatrix}$

Given present market shares are 15% for A and 85% for B ∴Market shares after one year

$$= \begin{pmatrix} 0.15 & 0.85 \end{pmatrix} \begin{pmatrix} 0.65 & 0.35 \\ 0.45 & 0.55 \end{pmatrix}$$

 $= ((0.15)(0.65) + (0.85)(0.45) \quad 0.15 \times 0.35 + 0.85 \times 0.55)$ = (0.0975 + 0.3825 0.0525 + 0.4675) = (0.48 0.52) \therefore Market shares after one year for A is 48% and for B is 52%

INTEGRAL CALCULUS-I

FORMULAE TO REMEMBER

- (i) Integration is the reverse process of differentiation
- (ii) $\int k f(x) dx = k \int f(x) dx$ where k is a constant.
- (iii) $\int [f(x) \pm g(x)] dx = \int f(x) dx \pm \int g(x) dx$
- (iv) The following are the four principal methods of integration
 - (i) Integration by decomposition
 - (ii) Integration by Parts
 - (iii) Integration by Substitution
 - (iv) Integration by successive reduction

First fundamental theorem of integral calculus :

If f(x) is a continuous function and $F(x) = \int_{-\infty}^{x} f(t)dt$, then F'(x) = f(x).

Second fundamental theorem of integral calculus :

$$\int_{a}^{b} f(x) dx = F(b) - F(a)$$

 $\int_{a}^{b} f(x) dx$ is a definite constant, whereas $\int_{a}^{x} f(t) dt$ is a function of the variable x

Indefinite integral :-

An integral function which is expressed without limits, and so containing an arbitrary constant. **Proper definite integral :-**

36

An integral function which has both the limits. *a* and *b* are finite. **Improper definite integral :-**

An integral function, in which the limits either *a* or *b* or both are infinite.

If f'(x) = x + b, f(1) = 5 and f(2) = 13, then 7. find f(x)

Sol: Given
$$f'(x) = x + b$$
, $f(1) = 5$ and $f(2) = 13$
 $f'(x) = x + b \Rightarrow \int f'(x) dx = \int (x+b) dx$

[:. Integration is the reverse process of differentiation]

$$\Rightarrow f(0) = \frac{x^2}{2} + bx + c \qquad \dots(1)$$

Given
$$f(1) = 5 \Rightarrow 5 = \frac{1^2}{2} + b(1) + c$$

 $\Rightarrow 5 = \frac{1}{2} + b(1) + c \Rightarrow 5 - \frac{1}{2} = b + c$
 $\Rightarrow \frac{10 - 1}{2} = b + c \Rightarrow b + c = \frac{9}{2}$
 $\Rightarrow 2b + 2c = 9$...(2)

Also
$$f(2) = 13 \implies 13 = \frac{2^2}{2} + b(2) + c$$

$$\implies 13 = 2 + 2b + c$$

$$\Rightarrow 13-2 = 2b+c$$

$$\Rightarrow 2b+c = 11 \dots(3)$$

$$(2)-(3) \rightarrow 2b+2c = 9$$

$$-2b+-c = -11 \qquad c = -2$$

Substituting $c = -2$ in (3) we get

$$2b - 2 = 11 \Rightarrow 2b = 11 + 2 \Rightarrow 2b = 13$$

 $\Rightarrow b = \frac{13}{2}$

Substituting $b = \frac{13}{2}$, c = -2 in (1) we get, $f(x) = \frac{x^2}{2} + \frac{13}{2}x - 2$

INTEGRAL CALCULUS-II

SNAPSHOT

Geometrical interpretation of definite integral is the area under a curve between the given limits. Integration helps us to find out the total cost function and total revenue function from the marginal cost. Consumer's surplus & producer's surplus theory was developed by the economist Marshal.

$$= 0.3 \left[500x - \frac{0.03x^3}{3} \right]_0^{30}$$

= 0.3 $\left[500x - 0.01x^3 \right]_0^{30}$
= 0.3 $\left[500(30) - 0.01(30)^3 \right] - 0 \right\}$
= 0.3 $\left[15000 - 0.01(27000) \right]$
= 0.3 $\left[15000 - 270 \right] = 0.3 (14730) = ₹ 4419.$

Hence, the total cost or maintaining inventory for 30 days = ₹ 4419.

5. An account fetches interest at the rate of 5% per annum compounded continuously An individual deposits ₹1,000 each year in his account. How much will be in the account after 5 years. $(e^{0.25} = 1.284)$.

Sol: Given P = ₹ 1000,
$$r = \frac{5}{100} = 0.05$$
 and N = 5
Amount after 5 years

$$= \int_{0}^{5} 1000 \ e^{0.05t} dt \quad [\therefore A = \int_{0}^{N} P e^{rt} dt]$$

$$= 1000 \int_{0}^{5} e^{0.05t} dt$$

$$= 1000 \left(\frac{e^{0.05t}}{0.05} \right)_{0}^{5} = \frac{1000}{0.05} \left(e^{0.05t} \right)_{0}^{5}$$

$$= 20,000 \left(e^{0.05(5)} - e^{0.05(0)} \right)$$

$$= 20,000 (e^{0.25} - e^{0})$$

$$= 20,000 (1.284 - 1)$$

$$[\because e^{0.25} = 1.284]$$

$$= 20,000 (.284) = ₹ 5680$$

Hence, the amount after 5 years will be ₹ 5680.

6. The marginal cost function of a product is given by $\frac{dC}{dx} = 100 - 10x + 0.1x^2$ where x is the output. Obtain the total and the average cost function of the firm under the assumption, that its fixed cost is ₹ 500.

Sol: Given marginal cost function

$$MC = \frac{dC}{dx} = 100 - 10x + 0.1x^{2}$$

$$\Rightarrow \qquad C = \int (100 - 10x + 0.1x^{2}) dx$$

$$\Rightarrow \qquad C = 100x - \frac{10x^{2}}{2} + \frac{0.1x^{3}}{3} + k$$
...(1)

orders@surabooks.com

🖞 Sura's 🗯 XII Std - Unit 3 🗯 Integral Calculus-II

Given fixed cost is ₹ $500 \Rightarrow k = 500$

 \therefore (1) becomes,

$$C = 100x - 5x^2 + \frac{0.1x^3}{3} + 500$$

Average cost function

$$AC = \frac{C}{x} = \frac{100x - 5x^2 + \frac{0.1x^2}{3} + 500}{x}$$
$$AC = 100 - 5x + \frac{0.1x^2 \times 10}{3 \times 10} + \frac{500}{x}$$

Average cost function

$$= 100 - 5x + \frac{x^2}{30} + \frac{500}{x}$$

7. The marginal cost function is $MC = 300 x^{5}$ and fixed cost is zero. Find out the total cost and average cost functions. [July - 2022]

Given MC = $300 x^{\frac{2}{5}}$ Sol: $\frac{dC}{dx} = 300 x^{\frac{2}{5}}$ \Rightarrow $\int d\mathbf{C} = 300 \int x^{\frac{2}{5}} dx$ \Rightarrow C = $300 \frac{x^{\frac{2}{5}+1}}{\frac{2}{5}+1} + k$ \Rightarrow C = $300 \frac{x^{\frac{1}{5}}}{\frac{7}{5}} + k$ \Rightarrow C = $300 \times \frac{5}{7}x^{\frac{7}{5}} + k$ \rightarrow $C = \frac{1500}{7}x^{\frac{7}{5}} + k$ \Rightarrow Given fixed cost is zero $\Rightarrow k = 0$ \therefore (1) becomes, $C = \frac{1500}{7}x^{\frac{7}{5}} + 0 \implies C = \frac{1500}{7}x^{\frac{7}{5}}$ Average cost function (AC) = $\frac{C}{r}$ AC = $\frac{1500}{7} \frac{x^{\frac{7}{5}}}{x}$ \rightarrow AC = $\frac{1500}{7} x^{\frac{7}{5}-1}$ \Rightarrow AC = $\frac{1500}{7} x^{\frac{2}{5}}$ \Rightarrow

8. If the marginal cost function of x units of output is $\frac{a}{\sqrt{ax+b}}$ and if the cost of output

is zero. Find the total cost as a function of x.

Sol: Given marginal cost function =
$$\frac{a}{\sqrt{ax+b}}$$

$$\Rightarrow MC = \frac{a}{\sqrt{ax+b}} \Rightarrow \frac{dC}{dx} = \frac{a}{\sqrt{ax+b}}$$

$$\Rightarrow dC = \frac{a}{\sqrt{ax+b}} dx$$

$$\Rightarrow \int dC = a \int \frac{dx}{\sqrt{ax+b}}$$

$$\Rightarrow C = a \int (ax+b)^{\frac{-1}{2}} dx$$

$$\Rightarrow C = a \int (ax+b)^{\frac{-1}{2}+1} + k$$

$$\Rightarrow C = \frac{(ax+b)^{\frac{1}{2}}}{\frac{1}{2}} + k$$

$$\Rightarrow C = 2\sqrt{ax+b} + k \qquad ... (1)$$
Since the cost of output is zero

Since the cost of output is zero

C = 0, when x = 0

$$\begin{array}{rcl} \therefore (1) \rightarrow & 0 &=& 2\sqrt{0+b+k} \\ \Rightarrow & 0 &=& 2\sqrt{b}+k \\ \Rightarrow & k &=& -2\sqrt{b} \end{array}$$

 \therefore (1) becomes

$$C = 2\sqrt{ax+b} - 2\sqrt{b}$$

9. Determine the cost of producing 200 air conditioners if the marginal cost (is per unit) is

$$C'(x) = \frac{x^2}{200} + 4$$

Sol: Given marginal cost MC = C'(x) = $\frac{x^2}{200}$ + 4

$$\Rightarrow \qquad \int MC = \int C'(x) = \int \left(\frac{x^2}{200} + 4\right) dx$$

To find the cost of producing 200 air conditioners

$$C = \int_{0}^{200} \left(\frac{x^{2}}{200} + 4\right) dx$$
$$= \left[\frac{1}{200} \times \frac{x^{3}}{3} + 4x\right]_{0}^{200} = \left[\frac{x^{3}}{600} + 4x\right]_{0}^{200}$$

$$= \left[\frac{(200)^3}{600} + 4(200)\right] - 0$$

= $\frac{8000000}{600} + 800 = 13333.33 + 800$
= ₹ 14133.33

Hence, the cost of producing 200 air conditioners is ₹ 14133.33

10. The marginal revenue (in thousands of Rupees) functions for a particular commodity is $5 + 3e^{-0} \ ^{03 \ x}$ where x denotes the number of units sold. Determine the total revenue from the sale of 100 units. (Given $e^{-3} = 0.05$ approximately)

Sol: Given marginal revenue MR = $5 + 3e^{-0.03x}$

$$\Rightarrow \qquad \frac{dR}{dx} = 5 + 3e^{-0.03x}$$
$$\Rightarrow \qquad dR = (5 + 3e^{-0.03x})dx$$

Total revenue from sale of 100 units is

$$R = \int_{0}^{100} (5+3e^{-0.03x}) dx$$

= $\left[5x+3\frac{e^{-0.03x}}{-0.03} \right]_{0}^{100}$
= $\left[5x-\frac{e^{-0.03x}}{0.01} \right]_{0}^{100}$
= $\left(5(100) - \frac{e^{-0.03(100)}}{0.01} \right) - \left(0 - \frac{e^{-0.03(0)}}{0.01} \right)$
= $500 - \frac{e^{-3}}{0.01} + \frac{e^{0}}{0.01}$
= $500 - \frac{.05}{0.01} + \frac{1}{0.01}$
= $500 - 5 + 100$
= $600 - 5 = 595$
otal revenue = $595 \times 1000 = ₹ 595000$
[: Revenue is given in thousands]

11. If the marginal revenue function for a commodity is $MR = 9 - 4x^2$. Find the demand function.

Sol: Given marginal revenue

 \Rightarrow

$$MR = 9 - 4x^{2}$$
$$\frac{dR}{dx} = 9 - 4x^{2}$$

$$\Rightarrow dR = (9 - 4x^{2}) dx$$

$$\Rightarrow \int dR = \int (9 - 4x^{2}) dx$$

$$\Rightarrow R = 9x - \frac{4x^{3}}{3} + k \dots (1)$$

When no product is sold, revenue is zero

 $\therefore \text{When } x = 0, \text{ R} = 0 \implies 0 = 0 - 0 + k \implies k = 0$ $4x^{3}$

 \therefore (1) becomes R = $9x - \frac{4x^3}{3}$

We know that R = Px where P is the demand function $\Rightarrow P x' = x' \left(9 - \frac{4x^2}{2}\right) \Rightarrow P = 9 - \frac{4x^2}{2}$

$$\Rightarrow \qquad P_{x} = x \left(9 - \frac{1}{3}\right) \Rightarrow P = 9 - \frac{1}{3}$$

Hence, the demand function is $9 - \frac{12}{3}$.

12. Given the marginal revenue function 4 -1, show that the average revenue

$$\frac{(2x+3)^2}{(2x+3)^2} = -1$$
, show that the
function is $P = -4 - 1$.

$$\frac{1}{(6x+9)} - 1$$

 \Rightarrow

 \Rightarrow

 \Rightarrow

Sol: Given marginal revenue function = $\frac{4}{(2x+3)^2} - 1$

$$\Rightarrow MR = \frac{dR}{dx} = 4 (2x+3)^{-2} - 1$$

$$\Rightarrow dR = [4 (2x+3)^{-2} - 1] dx$$

$$\Rightarrow \int dR = 4 \int (2x+3)^{-2} dx - \int dx$$

$$R = \frac{4(2x+3)}{2(-2+1)} - x$$

$$R = \frac{2(2x+3)^{-1}}{-1}$$

$$R = \frac{-2}{(2x+3)} - x + k \qquad \dots (1)$$

When x = 0, $R = 0 \Rightarrow 0 = \frac{-2}{3} - 0 + k \Rightarrow k = \frac{2}{3}$ \therefore (1) becomes $R = \frac{-2}{2x+3} - x + \frac{2}{3}$ R

We know that $R = Px \Rightarrow P = \frac{R}{x}$ \therefore Average revenue function

$$P = \frac{R}{x} = \frac{-2}{x(2x+3)} - \frac{x}{x} + \frac{2}{3x}$$
$$= \frac{-2}{x(2x+3)} - 1 + \frac{2}{3x}$$

orders@surabooks.com

🖞 Sura's 🗯 XII Std - Unit 3 🗯 Integral Calculus-II

$$= \frac{-2}{x(2x+3)} + \frac{2}{3x} - 1$$

$$= \frac{-6+2(2x+3)}{3x(2x+3)} - 1$$

$$= \frac{-\cancel{6}+4x+\cancel{6}}{3x(2x+3)} - 1$$

$$= \frac{4\cancel{x}}{3\cancel{x}(2x+3)} - 1 = \frac{4}{3(2x+3)} - 1$$

$$P = \frac{4}{6x+9} - 1$$

Hence Proved.

13. A firm's marginal revenue function is $MR = 20e^{\frac{-x}{10}} \left(1 - \frac{x}{10}\right).$ Find the corresponding demand function.

Sol: Given marginal revenue function

$$MR = \frac{dR}{dx} = 20e^{\frac{-x}{10}} \left(1 - \frac{x}{10}\right)$$
$$dR = 20e^{\frac{-x}{10}} \left(1 - \frac{x}{10}\right)dx + k$$
$$R = \int 20e^{\frac{-x}{10}} \left(1 - \frac{x}{10}\right)dx$$
ow that
$$\int e^{ax} \left[af(x) + f'(x)\right]dx = e^{ax} f(x) + f'(x)dx = e^{ax} f(x) + e^{ax} f($$

We know that $\int e^{ax} [af(x) + f'(x)] dx = e^{ax} f(x) + c$ Here $a = \frac{-1}{10}$, f(x) = x, f'(x) = 1 $R = 20 \int e^{\frac{-x}{10}} \left[-\frac{1}{10} x + 1 \right] dx = 20e^{\frac{-x}{10}} x + k$

$$R = 20e^{\frac{-x}{10}}x + k \qquad ...(1)$$

When x = 0, $R = 0 \Rightarrow 0 = 0 + k \Rightarrow k = 0$ (1) becomes $R = 20 x e^{\frac{-x}{10}}$

 $R = 20xe^{\frac{-x}{10}}$

 \Rightarrow

Demand function P =
$$\frac{R}{x} = \frac{20xe^{-1}}{x}$$

 \Rightarrow P = 20 $e^{\frac{-x}{10}}$

14. The marginal cost of production of a firm is given by C'(x) = 5 + 0.13x, the marginal revenue is given by R'(x) = 18 and the fixed cost is $\gtrless 120$. Find the profit function.

Sol: Given
$$C'(x) = 5 + 0.13x$$

 $R'(x) = 18$
Eived cost is $\neq 120$

Fixed cost is ₹ 120

$$C'(x) = 5 + 0.13x$$

$$\Rightarrow \int C'(x) = \int (5 + 0.13x) dx$$

$$\Rightarrow C(x) = 5x + \frac{0.13x^2}{2} + k_1$$

Since fixed cost is $\gtrless 120 \Rightarrow k_1 = 120$

$$\therefore C(x) = 5x + \frac{0.13x^2}{2} + 120 \dots (1)$$

Also
$$R'(x) = 18 \Rightarrow \int R'(x) = \int 18 \, dx$$

 $\Rightarrow \quad R(x) = 18x + k_2$
When $x = 0, R = 0 \Rightarrow k_2 = 0$
 $\therefore \quad R(x) = 18x$...(2)
Profit function
 $\Rightarrow \quad P(x) = R(x) - C(x)$

$$\Rightarrow P(x) = R(x) - C(x)$$

$$= 18x - 5x - \frac{0.13x^2}{2} - 120$$
[from (1) and (2)]
$$P(x) = 13x - 0.065 x^2 - 120.$$

15. If the marginal revenue function is $R'(x) = 1500 - 4x - 3x^2$. Find the revenue function and average revenue function.

Sol: Given

$$MR = R'(x) = 1500 - 4x - 3x^{2}$$

$$\Rightarrow \int R'(x) = \int (1500 - 4x - 3x^{2}) dx$$

$$\Rightarrow R(x) = 1500x - \frac{4x^{2}}{2} - \frac{3x^{3}}{3} + k$$

$$\Rightarrow R(x) = 1500x - 2x^{2} - x^{3} + k$$
When $x = 0$, $R = 0 \Rightarrow k = 0$

$$\Rightarrow R(x) = 1500x - 2x^{2} - x^{3}$$
Average revenue function $= \frac{R(x)}{x}$

$$= \frac{1500x - 2x^{2} - x^{3}}{x}$$
AR = $1500 - 2x - x^{2}$

16. Find the revenue function and the demand function if the marginal revenue for x units is $MR = 10+3x - x^2$.

Sol: Given MR =
$$10 + 3x - x^2$$

 $\frac{dR}{dx} = 10 + 3x - x^2$
 $\Rightarrow dR = (10 + 3x - x^2) dx + k$
 $\Rightarrow \int dR = \int (10 + 3x - x^2) dx$

SAMPLING TECHNIQUES AND STATISTICAL INFERENCE

		MUST KNOW DEFINITIONS
Sampling	A A	 Sampling is the process of selecting a sample from a population. Types of sampling : Non-Random sampling or Non-probability sampling. Random Sampling or Probability sampling.
Stratified Random Sampling Systematic Sampling	A A	First divide the population into sub-populations, which are called strata. The collection of all the samples from all strata gives the stratified random samples. Randomly select the first sample from the first k units. Then every k^{th} member, starting with the first selected sample, is included in the sample.
Sampling distribution		It is a frequency distribution which is formed with various values of a statistic computed from different samples of the same size drawn from the same population.
Estimation		The method of obtaining the most likely value of the population parameter using statistic is called estimation.
Estimator	\succ	Sample statistic used to estimate a population parameter.
Estimate		An estimate is a specific observed value of a statistic.
Point Estimation	\triangleright	When a single value is used as an estimate.
Interval Estimation		Finding limits within which the parameter would be expected to lie.
Null Hypothesis	×	A hypothesis which is tested for possible rejection under the assumption that it is true.
Alternative	A	Any hypothesis which is complementary to the null hypothesis.
Hypothesis Critical value		The value of test statistic which separates the critical region and the acceptance region. Type I Error : The error of rejecting H_0 when it is true. Type II Error : The error of accepting H_0 when it is false.

TEXTUAL QUESTIONS

EXERCISE 8.1

1. What is population?

Ans. The group of individuals considered under study is called as population.

2. What is sample?

Ans. A selection of a group of individuals from a population in such a way that it represents the population is called as sample.

3. What is statistic?

Ans. Any statistical measure computed from sample is known as statistic.

4. Define parameter.

Ans. The statistical constants of the population like mean (μ), variance (σ^2) are referred as population parameters.

5. What is sampling distribution of a statistic?

Ans. Sampling distribution of a statistic is the frequency distribution which is formed with various values of a statistic computed from different samples of the same size drawn from the same population.

6. What is standard error?

[PTA-1]

- Ans. The standard deviation of the sampling distribution of a statistic is known as its Standard Error.
- 7. Explain in detail about simple random sampling with a suitable example.
- **Ans.** In this technique the samples are selected in such a way that each and every unit in the population has an equal and independent chance of being selected as a sample.

Simple random sampling without replacement is followed. The following two methods are generally used.

(A) Lottery method : This is the most popular and simplest method when the population is finite. In this method, all the items of the population are numbered on separate slips of paper of same size, shape and colour. They are folded and placed in a container and shuffled thoroughly. Then the required numbers of slips are selected. (B) Table of Random number : The random number table has been so constructed that each of the digits 0,1,2,...,9 will appear approximately with the same frequency and independently of each other.

The various random number tables available are

- a. L.H.C. Tippett random number series
- **b.** Fisher and Yates random number series
- c. Kendall and Smith random number series
- d. Rand Corporation random number series.

Example : Tippett's table of random numbers is 20 items out of 6000.

Here we consider row wise selection of random numbers.

2754	9143	1405	9025	7002	6111	8816	6446

8. Explain the stratified random sampling with a suitable example.

Ans. In stratified random sampling, first divide the population into sub-populations, which are called strata. Then, the samples are selected from each of the strata through random techniques. The collection of all the samples from all strata gives the stratified random samples.

Example :

From the following data, select 68 random samples from the population of heterogeneous group with size of 500 through stratified random sampling, considering the following categories as strata.

Category1: Lower income class -39% **Category2:** Middle income class - 38% **Category3:** Upper income class- 23%

Sura's - XII Std - Business Mathematics and Statistics

Stratum	Homogenous group	Percentage from population	Number of people in each strata	Random Samples
Category1	Lower income class	39	$\frac{39}{100} \times 500 = 195$	$195 \times \frac{68}{500} = 26.5 \sim 26$
Category2	Middle income class	38	$\frac{38}{100} \times 500 = 190$	$190 \times \frac{68}{500} = 26.5 \sim 26$
Category3	Upper income class	23	$\frac{23}{100} \times 500 = 115$	$115 \times \frac{68}{500} = 15.6 \sim 16$
Total		100	500	68

- 9. Explain in detail about systematic random • 11. Explain in detail about non-sampling error. sampling with example.
- Ans. In systematic sampling, randomly select the first sample from the first k units. Then every k^{th} member, starting with the first selected sample, is included in the sample.

Procedure for selection of samples by systematic sampling method.

If we want to select a sample of 10 (i) students from a class of 100 students, then N 100

$$k = \frac{1}{n} = \frac{100}{10} = 10.$$

Thus, sampling interval = 10 denotes that for every 10 samples one sample has to be selected.

- (ii) The first sample is selected from the first 10 (sampling interval) samples through random selection procedures.
- (iii) If the selected first random sample is 5, then the rest of the samples are automatically selected as 5, 15, 25, 35, 45, 55, 65, 75, 85, [:: k = 10]95.

10. Explain in detail about sampling error.

- Ans. Errors, which arise in the normal course of investigation or enumeration on account of chance, are called sampling errors. Sampling Errors arise due to the following reasons:
 - (a) Faulty selection of the sample instead of correct sample by defective sampling technique.
 - (b) The investigator substitutes a convenient sample if the original sample is not available while investigation.
 - (c) In area surveys, while dealing with border lines it depends upon the investigator whether to include them in the sample or not. This is known as Faulty demarcation of sampling units.

Ans. The errors that arise due to human factors which always vary from one investigator to another in selecting, estimating or using measuring instruments are called Non-Sampling errors.

It may arise in the following ways:

- (a) Due to negligence and carelessness of the part of either investigator or respondents.
- (b) Due to lack of trained and qualified investigators.
- (c) Due to framing of a wrong questionnaire.
- (d) Due to apply wrong statistical measure.
- (e) Due to incomplete investigation and sample survey.

- Ans. 1. This method is economical as it saves time, money and labour.
 - 2. Personal bias is completely eliminated.
- 13. State any three merits of stratified random sampling. [HY-2019]
- **Ans.** 1. A stratified random sample can be kept small in size without losing its accuracy.
 - 2. It is easy to administer, if the population under study is sub-divided.
 - 3. It reduces the time and expenses in dividing the strata into geographical divisions, since the government itself had divided the geographical areas.
- 14. State any two demerits of systematic random sampling. [PTA-3]
- Ans. 1. Systematic samples are not random samples.
 - 2. If N is not a multiple of *n*, then the sampling interval (k) cannot be an integer, thus sample selection becomes difficult.

EXERCISE 8.2

1. Mention two branches of statistical inference? [March - 2020]

Ans. The two branches of statistical inference are Estimation and testing of hypothesis

2. What is an estimator?

Ans. An estimator is a sample statistic used to estimate a population parameter.

3. What is an estimate?

Ans. An estimate is a specific observed value of a statistic.

4. What is point estimation? [Govt.MQP-2019]

Ans. An estimate of a population parameter given by a single number is called as point estimation.

5. What is interval estimation?

Ans. Generally, there are situations where point estimation is not desirable and we are interested in finding limits within which the parameter would be expected to lie is called an interval estimation.

6. What is confidence interval?

Ans. The interval $[c_1, c_2]$ within which the unknown value of the population parameter is expected to lie is known as Confidence Interval.

7. What is null hypothesis? Give an example.

- Ans. Null hypothesis is the hypothesis which is tested for possible rejection under the assumption that it is true and it is denoted by H_0 .
- Eg : If we want to find the population mean has a specific value μ_0 , then the null hypothesis H_0 is $H_0 : \mu = \mu_0$

8. Define alternative hypothesis. [PTA-2]

Ans. Any hypothesis which is complementary to the null hypothesis is called as the alternative hypothesis and it is usually denoted by H_1 .

9. Define critical region.

Ans. A region corresponding to a test statistic in the sample space which tends to rejection of H_0 is called critical region.

10. Define critical value.

Ans. The value of test statistic which separates the critical region and the acceptance region is called the critical value or significant value.

Sura's - XII Std - Business Mathematics and Statistics

- 11. Define level of significance.
 - **Ans.** The probability of type I error is known as level of significance.
 - 12. What is type I error?
 - Ans. The error of rejecting H_0 when it is true is type I error.

13. What is single tailed test?

- Ans. When the hypothesis about the population parameter is rejected only for the value of sample statistic falling into one of the tails of the sampling distribution, then it is known as onetailed test.
- 14. A sample of 100 items, draw from a universe with mean value 4 and S.D 3, has a mean value 63.5. Is the difference in the mean significant at 0.05 level of significance? [PTA-3]

Sol : Sample size n = 100,

- Sample mean $\overline{X} = 3.5$
- Population mean $\mu = 4$

Population standard deviation $\sigma = 3$

Null Hypotheses : There is no significant difference in the mean. i.e., $H_0: \mu = 4$

Alternative Hypotheses : There is significant difference in the mean.

i.e., $H_1 : \mu \neq H$

The level of significance $\alpha = 5\% = 0.05$ Applying the test statistic,

$$Z = \frac{\overline{X} - \mu}{\frac{\sigma}{\sqrt{n}}}$$
$$\Rightarrow Z = \frac{3.5 - 4}{\frac{3}{\sqrt{100}}} = \frac{-0.5}{0.3} = -1.667$$

 $\Rightarrow |Z| = 1.667$ The table value $Z_{\frac{\alpha}{2}} = 1.96$ Here $Z < Z_{\frac{\alpha}{2}}$ i.e., 1.667< 1.96.

Inference : Since $Z < Z_{\frac{\alpha}{2}}$ at 5% level of

significance, the null hypothesis H_0 is accepted. Hence there is no significant difference in the mean.

1. The standard deviation of a sample of size 50 is 6.3. Determine the standard error whose population standard deviation is 6? [PTA - 1 & 4; Govt. MQP - 2019; May - 2022]

Sol : Sample size n = 50

Sample S.D s = 6.3

Population S.D $\sigma = 6$

The standard error for sample S.D is given by

S.E. =
$$\sqrt{\frac{\sigma^2}{2n}} = \frac{6}{\sqrt{2(50)}} = \frac{6}{\sqrt{100}} = 1.8974$$

Thus standard error for sample S.D = 1.8974

2. Mention the merits and demerits of the systematic random sampling. [PTA-4]

Sol : Merits

- 1. Personal bias is completely eliminated.
- 2. This method is economical as it saves time, money and labour.
- 3. The method requires minimum knowledge about the population in advance.

Demerits

- 1. This requires a complete list of the population but such up-to-date lists are not available in many enquiries.
- 2. If the size of the sample is small, then it will not be a representative of the population.
- 3. The mean life time of 50 electric bulbs produced by a manufacturing company is estimated to be 825 hours with the S.D. of 110 hours. If μ is the mean life time of all the bulbs produced by the company, test the hypothesis that $\mu = 900$ hours at 5% level of significance. [PTA-2]
- Sol : Given sample size n = 50Sample mean $\overline{x} = 825$ Population mean $\mu = 900$ Population S.D. $\sigma = 110$ Null hypotheses : $H_0 : \mu = 900$

Alternative hypotheses: H_1 : $\mu \neq 900$

The test statistic,
$$z = \frac{x - \mu}{\frac{\sigma}{\sqrt{n}}}$$

$$=\frac{823-900}{\frac{110}{\sqrt{50}}}=-4.82 \quad \therefore \ |z|=-4.82$$

01

As the significance level is $\alpha = 0.05$, $\frac{Z_{\alpha}}{\frac{1}{2}} = 1.96$ Here $|z| > \frac{Z_{\alpha}}{\frac{1}{2}}$ as 4.82 > 1.96

Inference : As $|z| > \frac{Z_{\alpha}}{2}$, H₀ is rejected. Hence, we can conclude that mean life time of the population of electric bulbs cannot be taken as 900 hours.

orders@surabooks.com

Inference: Since, the calculated value is much \bullet **2**. greater than table value i.e., $Z > Z_{\alpha}$, it is highly significant at 5% level of significance. Hence we reject the null hypothesis H₀ and conclude that the advertising campaign was definitely successful in promoting sales.

- **Sol** : If the occurrence of 5 or 6 on the die is called a success, then

Sample size = 900; Number of the success = 324

Sample proportion = $P = \frac{324}{900} = 0.36$

Population proportion (P) = Prob (getting 5 or 6 when a die is thrown)

$$= \frac{1}{6} + \frac{1}{6} = \frac{2}{6} = \frac{1}{3}$$

A sample of 100 measurements at breaking 1. strength of cotton thread gave a mean of 7.4 gram and a standard deviation of 1.2 gram. Find 95% confidence limits for the mean breaking strength of cotton thread.

[Govt.MQP-2019; Sep. - 2020; Aug. - 2021]

Sol : Given, sample size = 100, x = 7.4, since σ is unknown but s = 1.2 is known.

In this problem, we consider $\sigma = s$, $Z_{\alpha/2} = 1.96$

S.E.
$$= \frac{\sigma}{\sqrt{n}} = \frac{s}{\sqrt{n}} = \frac{1.2}{\sqrt{100}} = 0.12$$

Hence 95% confidence limits for the population mean are

$$\overline{x} - Z_{\alpha/2} \frac{\sigma}{\sqrt{n}} < \mu < \overline{x} + Z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$$
7.4 - (1.96 × 0.12) ≤ μ ≤ 7.4 + (1.96 × 0.12)
7.4 - 0.2352 ≤ μ ≤ 7.4 + 0.2352
7.165 ≤ μ ≤ 7.635

This implies that the probability that the true value of the population mean breaking strength of the cotton threads will fall in this interval (7.165,7.635) at 95%

2. An auto company decided to introduce a new six cylinder car whose mean petrol consumption is claimed to be lower than that of the existing auto engine. It was found that the mean petrol consumption for the 50 cars was 10 km per litre with a standard deviation of 3.5 km per litre. Test at 5% level of significance, whether the claim of the new car petrol consumption is 9.5 km per litre on the average is acceptable. [HY-2019]

Sol: Sample size n = 50 Sample mean x = 10 km Sample standard deviation s = 3.5 km

Population mean $\mu = 9.5$ km

Since population SD is unknown we consider $\sigma = s$ The sample is a large sample and so we apply Z-test Null Hypothesis: There is no significant difference between the sample average and the company's claim, i.e., H_0 : $\mu = 9.5$

Sura's - XII Std - Business Mathematics and Statistics

Alternative Hypothesis: There is significant difference between the sample average and the company's claim, i.e., $H_1 : \mu \neq 9.5$ (two tailed test)

The level of significance $\alpha = 5\% = 0.05$

Applying the test statistic

$$Z = \frac{x - \mu}{\frac{\sigma}{\sqrt{n}}} \sim N(0, 1); Z = \frac{10 - 9.5}{\frac{3.5}{\sqrt{50}}} \sim N(0, 1) = \frac{0.5}{\frac{0.5}{0.495}} = 1.01$$

Thus the calculated value 1.01 and the significant value or table value $Z_{\underline{\alpha}} = 1.96$

Comparing the calculated and table value, Here $Z < Z_{\alpha}$ i.e., 1.01 < 1.96.

Inference: Since the calculated value is less than table value i.e., Z < Z_{α} at 5% level of

significance, the null hypothesis H_0 is accepted. Hence we conclude that the company's claim that the new car petrol consumption is 9.5 km per litre is acceptable.

$$Z = \frac{51 - 52}{\frac{5}{\sqrt{50}}} = \frac{-1}{0.7071} = -1.4142$$

Since alternative hypothesis is of two tailed test we can take |Z|=1.4142

Critical value at 1% level of significance is $Z_{\alpha} = 2.58$

Inference : Since the calculated value is less than table value i.e., $Z < Z_{\frac{\alpha}{2}}$ at 1% level of significance, the null hypothesis H₀ is accepted. Therefore, we conclude that there is no significant difference between the sample mean and population mean $\mu = 52$ and SD $\sigma = 5$. Therefore $\mu = 49$ is rejected.

Z = $\frac{9.3 - 8.9}{\frac{1.6}{\sqrt{50}}} = \frac{0.4}{0.2263} = 1.7676$

Calculated value Z = 1.7676

Critical value at 5% level of significance is $Z_{\frac{\alpha}{2}} = 1.96.$

Inference : Since the calculated value is less than table value i.e., $Z < Z_{\frac{\alpha}{2}}$ at 5% level of significance, the null hypothesis is accepted.

Therefore we conclude that an ambulance service claims on the average 8.9 minutes to reach its destination in emergency calls.

5. A machine produces a component of a product with a standard deviation of 1.6 cm in length. A random sample of 64 components was selected from the output and this sample has a mean length of 90 cm. The customer will reject the part if it is either less than 88 cm or more than 92 cm. Does the 95% confidence interval for the true mean length of all the components produced ensure acceptance by the customer? [May & July - 2022]

95% confidence interval for population mean μ

are $\overline{x} - z_{\frac{\alpha}{2}}(S.E) \le \mu \le \overline{x} + z_{\frac{\alpha}{2}}(S.E)$ As the level of significance is $\alpha = 0.05$, $Z_{\frac{\alpha}{2}} = 1.96$

$$\therefore 67.9 - (1.96) (\sqrt{0.7}) \le \mu \le 67.9 + (1.96) \sqrt{0.7}$$

$$\Rightarrow 67.9 - 1.64 \le \mu \le 67.9 + 1.64$$

$$\Rightarrow 66.2 \le \mu \le 69.54$$

Thus, the 95% confidence intervals for estimating μ is given by (66.2, 69.54).
